

Good catch with the file encoding.

Nice use of the equal-tilde pattern matching syntax.

Good job iterating the Ruby way with do blocks.

For terseness, `[a-zA-Z]` pattern can be represented as `[a-zA-Z]` as well. Also, your pattern does not check for other word characters (such as numbers, hyphens, underscores, etc), which are all valid domain names. You may do so with `\w` pattern. Not a huge deal; just FYI.
